Main Topics

- New technologies of genetic modification and biodiversity
- Challenging Homo sapiens biounicity
- New genomic technologies and biodiversity
- The fall of human races, the many human species and their relationships
- Diversity and evolution of genomes
- From the plastics revolution to the bioplastics evolution
- Insights into insect biology to control pathogen vectors and agricultural pests
- Present and future of single cell studies
- Microbiome modulation for improving human and plant health
- Novel therapeutic targets for precision medicine
